Process & Decision Documentation

Side Quests and A4 (Individual Work)

The goal was to add sound. I did this by downloading a dog barking sound form pixbay and uploading that to the repository folder I had made on my computer. I then created a file called sounds and added the bark.mp3 within it (so that it would be easy to call on later in the code). I added a const so that the sound wouldn't be modified/changed in any way. Then I created a new variable (barkSound) so that I could load the sound into the game making sure that it resets every time and while adding a catch so that error messages wont display if the sound doesnt work. I created this so that I can call on the sound later specifically to play whenever the user attacks the boar (pressing space).
